
MipNeRF360 bonsai, images_2, stage2-v2 format. Backbone points per level (K1024 R1, K4096 R1/256/1024/4096, K16384 R4096). Unlike Room, the 100 % level dominates: at equal bytes 100 % vertices with a small dictionary beats 80 % with a large one, so the allocator keeps every vertex and spends bytes on the dictionary first.
